## Education

### Ege University, Computer Programming - Associate Degree

September 2018 - June 2020

## Projects

### Airtable Powered Static Site

CMS that fetches data from Airtable and turns it into a static site. Used Gatsby.js, Scss and TypeScript for this project.

[Source](#)

### Spotify Clone

A shallow clone of Spotify Web. Used TypeScript, React and Scss also used Jest and Enzyme for testing for front-end, Express.js, Mongoose, Babel and Node.js for backend. Also it's worth mentioning that I used Figma for designing the prototype.

My own twist in this is the site is responsive and works on mobile screens just fine.

Learned about what a proper project structure should be, how to clean code, a lot of back-end stuff, auth & much more.

### Car Calendar

This is an app that I developed for a Rent a Car business. User selects a date from the calendar, adds a car and the app pushes notification one day before the selected date at 9 PM. Made with React Native. Also used TypeScript, Jest and react-native-testing-library for this project.

### Arcus

Native mod manager for Linux built with Electron. Although Arcus is far from done, I learned a lot about advantages and disadvantages of Electron and further improved my skills in Javascript and programming in general.
